

#### **Leeds Major Trauma Centre**

Welcome to the Leeds Major Trauma Centre

"Our aim is to save lives and return people to life free from disability"

# Trauma Laparotomy and Thoracotomy: indications, principles and limitations

Tim Stansfield FRCS MSc RAMC
Consultant Vascular and Trauma Surgeon
Military Consultant Surgeon Defence Medical Group (North)
LTHNT MTC Education programme
11 Nov 2016

### Content

- Resuscitative thoracotomy
- Command huddle
- Communication in damage control resuscitation
- Trauma laparotomy

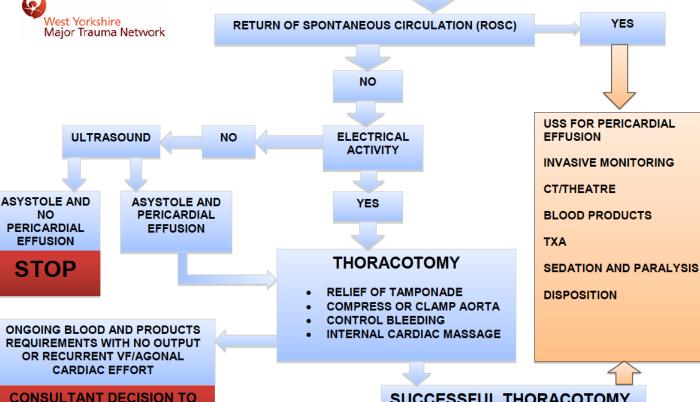

#### TRAUMATIC CARDIAC ARREST IN THE **EMERGENCY DEPARTMENT OR DURING** AMBULANCE TRANSFER TO THE FACILITY (1,7)

#### TRAUMATIC CARDIAC ARREST **GUIDELINE**

STOP RESUSCITATION

- ETT OR LMA (No drugs required)
- STOP CHEST COMPRESSIONS OR CONTINUE WITH CAUTION(2)
- **BILATERAL THORACOSTOMIES**
- CONTROL BLEEDING (DIRECT PRESSURE +/- TOURNIQUET) AND **BIND PELVIS (in blunt trauma)**
- LARGE BORE ACCESS WITH BLOOD/FLUID (4 UNITS IDEALLY)
- CONSIDER PERI-MORTEM DELIVERY OF BABY IF >20 WKS (ideally after 3-4 minutes of maternal arrest and before 20 minutes post arrest)(5,6)

#### PREPARATION AND **CONCURRENT ACTIVITY CHECKLIST**

- PRE- ALERT TRAUMA TEAM AND VASCULAR CONSULTANT
- ALLOCATE ROLES- YOU CANNOT PERFORM THORACOTOMY AND BE **TEAM LEADER**
- SEND A RUNNER FOR 4 UNITS O-ve BLOOD & WARN LAB OF MAJOR HAEMORRHAGE (SEND G&S ASAP)
- **TURN ON US MACHINE**
- PREPARE FLUID WARMER
- ALERT THEATRE AND CT
- PREPARE THORACOTOMY PACK
- TIME-KEEPER/SCRIBE TO BE KEPT SEPARATE FROM CLINICAL TEAM

If ROSC achieved and further advice needed contact cardiac surgical OR thoracic surgical consultant on-call at LTHT

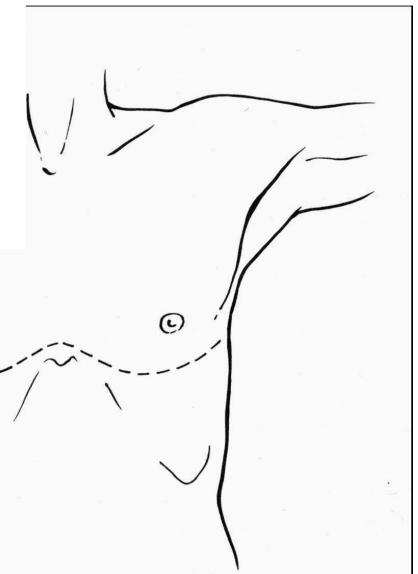

SUCCESSFUL THORACOTOMY

Traumatic cardiac arrest guideline LTHT / WYMTN 2015

### Clam Shell Incision

 Male: Just Below Nipple line

 Female: Inframammary fold incision

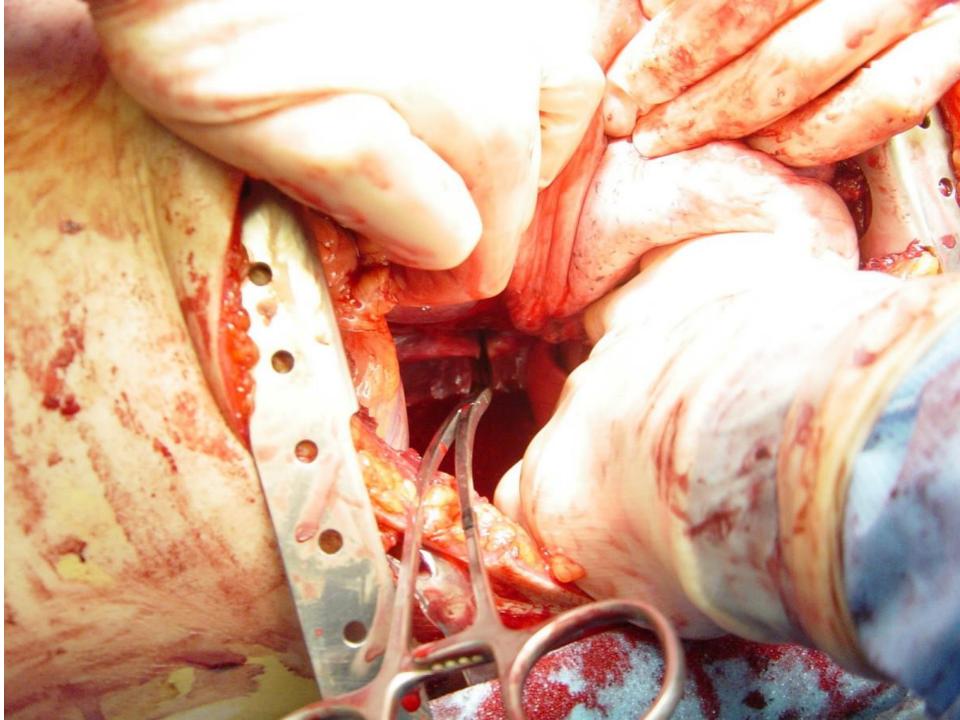

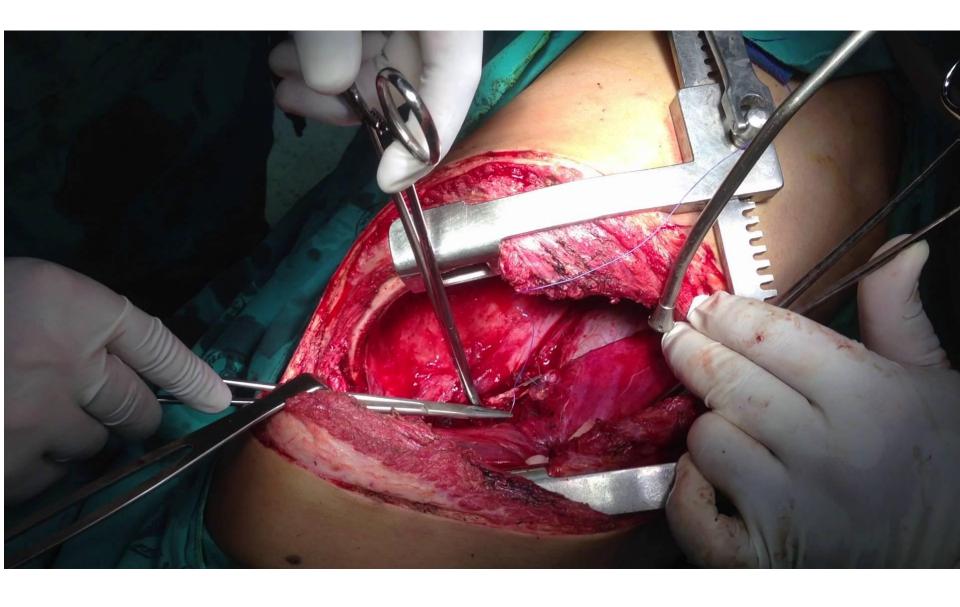

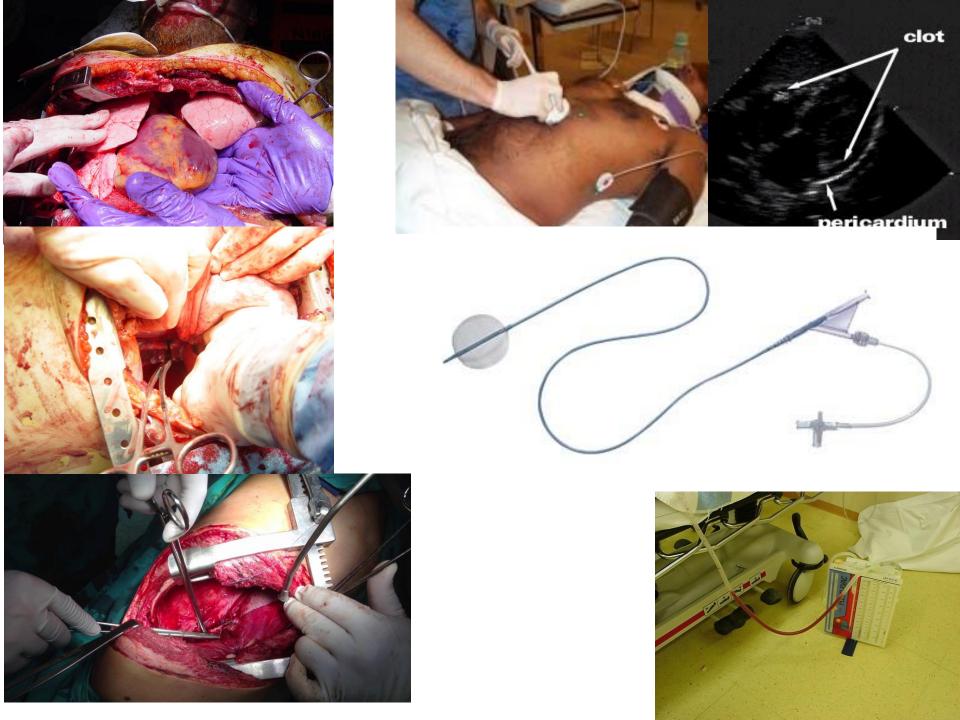

Better access to the great vessel origins and apices

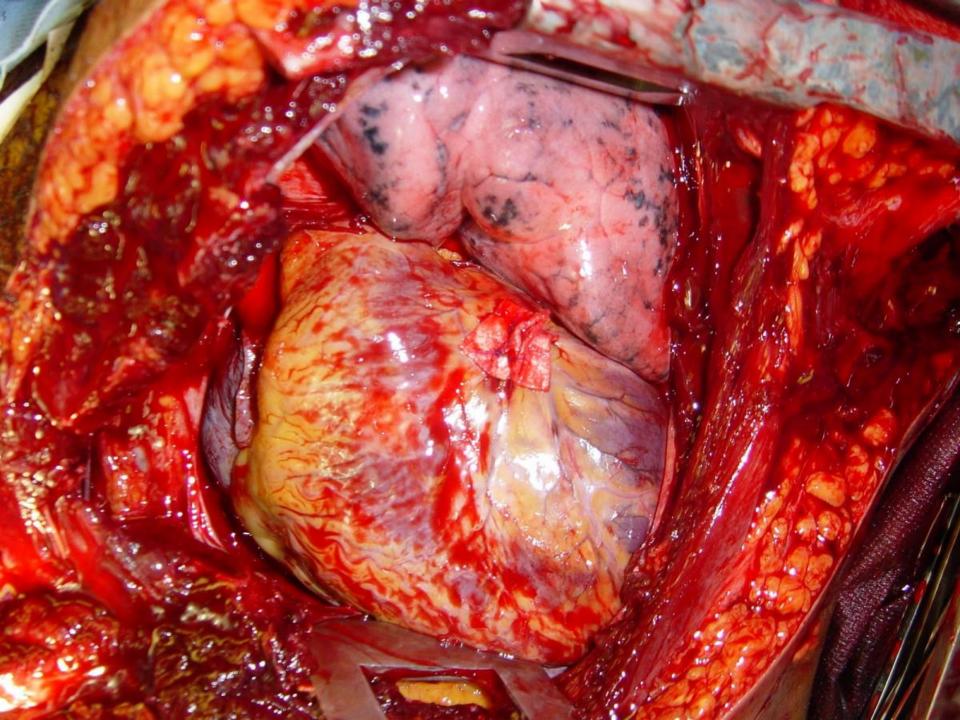

The apex and intercostals can be very tricky....

### Resuscitative Thoracotomy outcomes

## Resuscitative Thoracotomy complications

- One handed ICM technique: fracture of ventricle with thumb
- Using the coronary artery as a buttress to a suture of cardiac laceration
- Incorporating the pulmonary hilum into the division of inferior pulmonary ligament
- Clamping the aorta and then over resuscitating
- Cardiac arrest on primary closure of cavity
- Retained haemothorax: empyema
- Health care worker injury

### The effects of thoracic aortic cross-clamping and declamping on visceral organ blood flow.

Oyama M, McNamara JJ, Suehiro GT, Suehiro A, Sue-Ako K.

#### **Abstract**

Blood flow was measured using radioactive microspheres in 11 macaque monkeys 1) before hemorrhage shock, 2) after onset of shock, 3) after aortic cross-clamping and resuscitation, and 4) after release of the cross-clamp and stabilization. Hemodynamic parameters (cardiac output, arterial, right atrial and left atrial pressure) and blood gases were also monitored. Total abdominal organ flow fell with hemorrhage and fell further with aortic clamping. Reinfusion of shed volume did not restore abdominal organ flow (4.7% baselines) but increased LAP and cardiac output to the upper body. Release of the cross-clamp produced profound acidosis that was treated effectively with NcHCO3. After stabilization of blood, flow to kidney remained low (49% baseline) although intestinal flow was increased threefold (320% of baseline). It is clear that thoracic aortic cross-clamping in shock further compromises already reduced visceral blood flow and may contribute to the problem of ischemic multiple organ failure after resuscitation from hemorrhagic shock.

### Vital for SNOM, IR and neurosurgeial decision making

Catastrophic haemorrhage needs immediate treatment despite uncertainty to CNS lesion

Which cavity first?

### Injuries probably requiring OT first

- GSW chest/abdm, SBP 70, clamp on T. Aorta
- Blast lower limbs blown off, torso/ abdm fragmentation wounding, Fast +ve, massive transfusion ongoing
- Jumped 50ft from building CPR ongoing
- Paedestrian vs car at 40mph, SBP 70, Chest drain blood
- Precordial stab CPR 10mins

### If going to the OT

- 1. Let OT know
- 2. Cell Salvage
- 3. Turn off the laminar flow
- 4. Turn the OT temp to max
- 5. Buy a:

### Should we do DCS?

- Operative strategy that sacrifices completeness for the immediate surgical repair in order to address the consequences of the double hit of the injury and then added surgery\*
- Indications
  - ISS >25
  - SBP <70mmHg</p>
  - Core temp <34°C</li>
  - pH < 7.1
- Rationale
  - Must be done promptly
  - Prevent further spiral in to lethal triad

### DCS indication

#### Table 1. Indications for damage control

- 1. Hemodynamic instability
- Coagulopathy on presentation or during operation (clinical or laboratory)
- Severe metabolic acidosis (pH <7.2 or base deficit >8)
- 4. Hypothermia on presentation (<35°C)
- 5. Prohibitive operative time required to repair injuries (>90 mins)
- 6. High-energy blunt torso trauma
- 7. Multiple penetrating torso injuries
- Multiple visceral injuries with major vascular trauma
- 9. Multiple injuries across body cavities
- Massive transfusion requirements (>10 units packed red blood cells)
- Presence of injuries better treated with nonsurgical adjuncts

### What I'm thinking

- How sick is this patient?
- How much blood can the patient lose in this environment?
- Which surgical strategy is going to most benefit the patients physiology over the next 24hrs? verses which surgical strategy is going to provide the least morbidity?
- Which surgical strategy is going to fail best?

### **Human factors in contingency** operations

Simon J Mercer, <sup>1</sup> MA Khan, <sup>2</sup> T Scott, <sup>3</sup> JJ Matthews, <sup>4</sup> DCW Henning, <sup>5,6</sup> S Stapley'

#### **ABSTRACT**

The UK Defence Medical Services are currently supporting contingency operations following a period of intensive activity in relatively mature trauma systems in Iraq and Afghanistan. Among the key lessons identified, human factors or non-technical skills played an important role in the improvement of patient care. This article describes the importance of

Role 2 or Role 3 providing support to 127 Squadron (16 Medical Regiment), Role 2 Land Based (in support of the British Army and Royal Marines), Role 2 Afloat (R2A), Vanguard Role 3 Field Hospital and the Primary Casualty Receiving Facility (RFA ARGUS).

For more than a decade, the DMS was operational in both Iraq (Operation

followership, communication and situational awareness with individual systems developed for anaesthetists, 16 surgeons 17 and scrub practitioners. 18 This paper concentrates on the importance of human factors on a Role 2 Afloat (R2A) platform, as the authors have considerable recent experience in this environment, but the concepts are readily transferable to other small teams deployed either on military contingency operations or on civilian disaster relief settings.

#### **ROLE 2 AFLOAT**

The modern configuration of R2A has already been described<sup>19</sup> and the composition of the team is noted in Box 1. The

### Communication in DCR/DCS

The Trauma "WHO"	SNAP Brief	SIT -REPS (every 10-30mins)
<ol> <li>Command Huddle</li> <li>(STOP or GO): Gen Surg/ Ortho/ Anaesth/ ED/ IR</li> </ol>	Patient identification	S – SBP (and surgical progress)
2. SNAP Brief	Clinical/Ix findings, Surgical Plan (A,B,C), duration of surgery proposed	T – Temp (and time)
3. SIT REPS	Anaesthetic brief see STACK	A – Acidosis/ BE
4. Debrief		C - Coagulation
