

*After  
an  
Accident or  
Trauma*

A leaflet for patients who have  
been involved in an accident  
or traumatic event.

Traumatic experiences such as accidents are, of course, very distressing to those involved. Most of us rarely have to deal with them. When we do, we often get emotional and physical reactions to what has happened that can be confusing and frightening.

This is a short guide to the reactions that often follow a traumatic event. It is based on what others who have been through similar traumatic experiences have said about how they feel afterwards. Not all of this may apply to you, but if any does, remember that this is all part of a natural process of recovery after your traumatic experiences.

What follows is a description of the feelings and thoughts you might have, and how you might feel physically. Your mind and body need time to adjust to what you have been through. Your mind may need to go over what happened many times to help it fade into memory and your body might feel as if it is on alert for a while, until it realises that the danger has passed. There are some things that you can do that may help this process, and these are described on the following pages.

## What you may feel after an accident

- Sadness** Deep feelings of sadness are common, particularly when someone has died or been badly injured.
- Helplessness** Accidents can be overwhelming, and leave you feeling quite powerless.
- Re-experiencing** If an accident has had a big effect on you, you may find yourself re-experiencing it long after it is over. Sometimes you may re-experience it in dreams or flashbacks; sometimes you may just get the feelings back that you had during or after the event. Sometimes, you may feel as if the original event is about to happen again. All this can be very distressing and frightening, but it is a normal reaction.

## Numbness

The shock of an accident can leave you feeling numb and emotionally exhausted. Sometimes this can give you time to get your feelings sorted. Sometimes it can leave you feeling less able to cope with other problems and feeling quite strange. It may make you feel like withdrawing from the company of others and lose interest in enjoyable activities.

## Let down

Sometimes accidents can fundamentally change a person's outlook on life. Hopes may feel dashed, and you may feel disillusioned or disappointed, or feel you are living on borrowed time.

## Nervousness

Your body may feel full of energy, making it difficult to rest, fall asleep, or have peace of mind. You may find that you become a little forgetful, or find it hard to concentrate. Sometimes your distress and discomfort find an outlet in crying. You may find yourself crying over the smallest things and this can be confusing

or embarrassing, though it is a good way to let your feelings out.

## Anger

Quite intense feelings of anger are quite common. This may be over something trivial, or may be felt about the injustice of the accident or those who appear to have let it happen. This anger may feel "out of character".

## Fear

New fears and anxieties may emerge, perhaps about leaving the house, perhaps a fear of leaving loved ones, perhaps a fear of "losing control" or "not coping". You may worry that the original accident may happen again. You may be very scared about going back to the place where the accident happened or feel "jumpy" in circumstances similar to the accident.

## Guilt

If others were killed or badly injured in the accident, a common reaction is to feel guilty at surviving rather than relief. You may wonder why you deserve to have survived, rather than others.

## How you might be affected physically

- Tiredness                      Events such as accidents place the body under intense stress, and this does not necessarily stop when it is over. You may continue to be tense leading to tiredness and, later, exhaustion.
- Muscle tension                The strain you may be under expresses itself in tensing muscles in different parts of the body, and this can produce symptoms such as stiffness, headache, pains, choking sensations in the throat, dizziness and chest pains.
- Palpitations                    All strong emotional reactions are associated with changes in the body such as palpitations of the heart, sweating, mild tremors (and perhaps shaking), stomach pains, and indigestion.

*Remember - you may experience some or all of these reactions at different times. They are part of the natural process of healing. Typically, they will diminish fairly soon before fading away eventually. If they do not, it is important to help them by talking to someone about it*

## How you can help yourself

Above all else, try to avoid bottling up feelings you have about what happened, however shocked or surprised you may be. Remember, letting your feelings show is not a sign of weakness, it is the only way to deal with them. Talking really does help. You may also find it helpful to do the following at different times:

- You may need to think and talk about the accident over and over again, to come to terms with it. Let yourself experience the feelings you have about what happened and talk to others about it.
- Don't forget that your family and friends may have similar feelings to yourself - share your feelings with each other.
- You may find yourself thinking about the meaning of life following the accident. Let yourself do this, and continue to make plans for the future.
- Concentrate on other things and try to keep busy, though not to the extent where you try to avoid thinking about the accident at all.
- Don't expect your memories to go away overnight, but try and get on with your life as soon as you can.

- Remember, too, that following severe stress people are likely to be a little more distracted, so be extra careful for a while

### **When you need further help**

These reactions to a traumatic event usually fade away over time. Sometimes, for whatever reason, they do not, and you may need to talk to someone trained to help in such situations, such as a Clinical Psychologist. If you feel that you would benefit from this, please speak to someone involved in your care, such as your Surgeon, Nurse or GP, who will then be able to arrange this for you.

*It is worthwhile thinking about doing this if:*

- Your intense feelings or bodily sensations continue to be overwhelming.
- Your feelings are not falling into place.
- Memories, dreams and images of the accident continue to come back.
- You have nightmares or cannot sleep.
- You can't find relief from tension, confusion, or a sense of emptiness or exhaustion.

- You still have problems concentrating.
- You feel that you have to keep active otherwise you'll get upset.
- You find yourself getting uncontrollably angry.
- You have no one to share your feelings with.
- Your relationships are suffering, or others comment on "how much you've changed".
- You find yourself prone to accidents.
- Your smoking, eating or drinking habits are getting worse.
- You feel you are relying more on medication.
- You find that you are avoiding activities and this is disrupting your daily life. For example, avoiding travelling in a car after being involved in a car accident.
